

Service economics: who gets what on every call

Every listed service, its price, the split between BotTrunk and the seller, what it costs to fulfil, and what is left. Lempira figures use the reference rate the gateway was pricing with when this was prepared, L26.8569 / USD (Banco Central de Honduras reference, refreshed hourly). Prices for the deposit tiers move with that rate; everything else is fixed.

1. Rules that apply to every paid call

What the agent pays

Exactly the amount in the 402, in USDC, from its own wallet. Nothing else: the Algorand network fee (0.001 ALGO per transaction, about \$0.0001) is paid by the GoPlausible facilitator's fee-payer account ZMFK20...22AA, so the agent needs no ALGO. The facilitator charges no fee for this today.

What lands, and where

100% of the USDC goes on-chain from the payer straight to the gateway wallet UTWS33...MRE (Defly). BotTrunk never holds it in transit and there is no intermediary cut. It is your money the moment the transfer confirms (~4 s).

The ledger split

Each settled call is recorded as **15% BotTrunk commission + 85% seller share** (integer μ USDC, rounded in the seller's favour). For services BotTrunk runs itself, both halves are yours; the split only matters as bookkeeping until outside sellers exist, when their 85% is paid out from the gateway wallet.

When nothing is charged

If the service refuses the request (bad input, limits) or fails, the gateway never calls settle: the agent keeps its USDC. A service marked *coming soon* answers 503 and cannot be bought. Refunds after settlement (a deposit that could not be delivered) are manual, from the gateway wallet, and recorded on the order.

Fixed costs behind all of this: Render web service + Postgres $\approx$ \$13/month, the domain $\approx$ \$2/month. There is no per-call infrastructure cost worth counting.

2. All services, at today's rate

SERVICE	PROVIDER	STATUS	PRICE (USDC)	BOTTRUNK 15%	SELLER 85%	WHO THE SELLER IS
scrape-markdown	BotTrunk	live	0.005000	0.000750	0.004250	you (both halves)
deposit-bac-1000	Human-fulfilled	live	41.408833	6.211325	35.197508	you (both halves)
deposit-bac-2500	Human-fulfilled	live	103.522083	15.528312	87.993771	you (both halves)
deposit-bac-5000	Human-fulfilled	live	207.044165	31.056625	175.987540	you (both halves)
deposit-bac-10000	Human-fulfilled	live	414.088330	62.113249	351.975081	you (both halves)
pdf-extract	BotTrunk	coming soon	0.020000	0.003000	0.017000	you
screenshot	BotTrunk	coming soon	0.010000	0.001500	0.008500	you
send-whatsapp	Verified seller	coming soon	0.050000	0.007500	0.042500	outside seller — paid out
verify-business-hn	Human-fulfilled	coming soon	5.000000	0.750000	4.250000	the local verifier — paid out
translate-es-en	Human-fulfilled	coming soon	0.500000	0.075000	0.425000	the translator — paid out

Deposit prices are rounded up to the μ USDC at pricing time, which is why the listing shows 41.408833 rather than the exact quotient. The four tiers repriced together when the rate changes; the other prices are constants in the catalog.

3. Worked example: deposit-bac-1000 at \$41.408833

This is the listing you quoted — "\$41.408833 USDC per call · $p_{50} \leq 24$ h · 100% success · Algorand MainNet · USDC · GoPlausible · Human-fulfilled". Here is every piece of that number and where each piece ends up.

How the price is built

Reference rate (BCH)	L26.8569 / USD
Your spread	– L1.50
Rate the buyer gets	L25.3569 / USD
L1,000 at the buyer's rate	39.437 USDC
Fee 5%	+ 1.972 USDC
Price in the 402	41.408833 USDC

Where the 41.41 USDC goes

Agent pays	41.408833 USDC
Network fee (facilitator pays)	0.002 ALGO $\approx$ \$0.0002
Lands in gateway wallet	41.408833 USDC
ledger: BotTrunk commission 15%	6.211325
ledger: seller share 85%	35.197508
Yours, on-chain	41.408833 USDC

What it really costs you, and what is left

You transfer to the beneficiary (BAC → BAC, no bank fee)	L1,000.00 = 37.234 USDC at the reference rate		
Margin from the spread (1000 ÷ 25.3569 – 1000 ÷ 26.8569)	2.203 USDC		≈ L59.15
Margin from the 5% fee	1.972 USDC		≈ L52.96
Gross margin per L1,000 deposit	4.175 USDC	≈ L112.11 · 10.1% of the amount sent	
Cost of turning USDC back into lempiras (exchange / P2P spread, typically 1–2% of 41.41 USDC)	– 0.41 to 0.83 USDC		≈ L11 – L22
Net per L1,000 deposit, after off-ramp	≈ 3.35 – 3.76 USDC		≈ L90 – L101

The gross margin is exactly what the two knobs produce: the L1.50 spread is worth about 5.9% and the fee 5.0% of the lempiras delivered; together 10.1%. If you ever remove the spread, the fee alone leaves ≈ L52 per L1,000; if you drop the fee, the spread alone leaves ≈ L59.

The same, for all four tiers

TIER	PRICE (USDC)	YOU PAY OUT	= USDC AT REFERENCE	SPREAD MARGIN	FEE MARGIN	GROSS MARGIN	GROSS IN L	NET AFTER 1.5% OFF- RAMP
deposit-bac-1000	41.408833	L1,000	37.234	2.203	1.972	4.175	L112.11	≈ L95
deposit-bac-2500	103.522083	L2,500	93.086	5.507	4.930	10.436	L280.28	≈ L239
deposit-bac-5000	207.044165	L5,000	186.172	11.013	9.859	20.872	L560.57	≈ L477
deposit-bac-10000	414.088330	L10,000	372.344	22.026	19.719	41.745	L1,121.13	≈ L954

Exposure: with the limits in place (max L10,000 per order, 3 settled orders per beneficiary account per day) a single account can draw at most L30,000 of your float in a day, and every one of those orders is already paid in USDC before it reaches your queue.

4. The rest of the catalog, one by one

scrape-markdown — 0.005 USDC, live, fulfilled by BotTrunk's own code

Agent pays	0.005000 USDC (5,000 µUSDC)
Network fee	0.001–0.002 ALGO, paid by the facilitator
Lands in gateway wallet	0.005000 USDC
Ledger	commission 0.000750 · seller 0.004250 (both yours)
Fulfilment cost	≈ 0 – one HTTP fetch and a markdown conversion on the Render box
Net	0.005 USDC per call. 200 calls = \$1. The value here is leaderboard volume and agents discovering BotTrunk, not the margin.

pdf-extract 0.02 · screenshot 0.01 — coming soon, BotTrunk-run

When live, same shape as scrape-markdown: 100% lands, 15/85 bookkeeping, both halves yours. Fulfilment cost will be compute (a headless browser for screenshots, an LLM or parser for PDFs); at these prices the margin is thin until a real upstream and a real cost are known, which is why they are not sold yet. Today they answer 503 and cannot be charged.

send-whatsapp — 0.05 USDC, coming soon, outside verified seller

Agent pays	0.050000 USDC
Lands in gateway wallet	0.050000 USDC
BotTrunk keeps	0.007500 USDC (15%)
Seller receives	0.042500 USDC (85%), paid out from the gateway wallet by the payout job (Phase 2)
Seller's own cost	WhatsApp Business / Twilio per-message fees – theirs, not yours

verify-business-hn — 5.00 USDC, coming soon, human-fulfilled

Agent pays	5.000000 USDC
BotTrunk keeps	0.750000 USDC (15%)
Verifier receives	4.250000 USDC (85%) ≈ L114 at the reference rate, after they deliver the proof bundle (escrow-until-proof)
Note	At L114 for a site visit plus a registry check the price is low for the work; expect to raise it (a tramitador charges more) or route it to the deposit-style queue with a higher tier.

translate-es-en — 0.50 USDC, coming soon, human-fulfilled

Agent pays	0.500000 USDC
BotTrunk keeps	0.075000 USDC (15%)
Translator receives	0.425000 USDC (85%) ≈ L11.4 per job of up to 2,000 words – not viable for a human; needs per-word pricing before it goes live.

5. Where the money sits and how it reaches you

1. Every settled call adds USDC to the gateway wallet
UTWS33TM7IT7NINJSFWS5KVGL73G4ERJMYDKHF7KE4WDXHY04L7V2PNMRE on Algorand MainNet. Balance today $\approx$ 15 USDC from test calls, plus ALGO.
2. For deposits you pay lempiras out of the BAC account and refill it by selling USDC (exchange with Algorand USDC support, or P2P). That conversion is the only real cost in the deposit business, and it is what the spread is for.
3. For outside sellers (none yet), their 85% is paid out from the same wallet; your 15% stays.
4. The ledger (calls) and /admin/stats show volume and commission per service per day, so the numbers in this document can be checked against reality at any time.

Assumptions: BCH reference 26.8569 (live value when prepared); network fee 0.001 ALGO $\approx$ \$0.0001 at $\sim$ \$0.09/ALGO; off-ramp cost 1–2% is an estimate — replace it with the spread your exchange actually charges. All USDC figures are μ USDC-exact where shown to six decimals.
